

Which holds the most?

You need:

- a variety of different containers
- rice
- kitchen measuring cups
- paper and pencil to record your results

What to do:

1. Measure the volume of one of the containers by filling it with rice then measuring the volume of rice used with the measuring cups. Record your result.
2. Measure the volume of all the containers, one at a time, using the same method.
3. As you work, place the containers in a line with the container with the smallest capacity at one end and the container with the largest capacity at the other.
