

Pareto's Rule

You need ★ a computer spreadsheet or calculator ★ a globe

Pareto's "rule" is based on an observation by a famous economist, Vilfredo Pareto (1848–1923). The rule is:

80 percent of the effects typically come from 20 percent of the causes.

Vilfredo Pareto

I wonder what this means in terms of eco-footprints?

Broadly speaking:

- most people in developed countries have a high standard of living
- most people in developing countries have limited resources.

Activity One

1. People in developed countries use resources at a rate similar to Adena's (see pages 4–5). If all the people in the world (100 percent) lived like Adena, we'd need 3.6 Earths to support them.

In 2009, only 1 168 530 000 of the world's 6 778 070 000 people lived in developed countries.

- a. What percentage of people live in developed countries?
- b. How many Earths are consumed by people in developed countries?
- c. How much of Earth's resources are left for people in developing countries?
- d. What percentage of people live in developing countries?
- e. If everyone in the world lived like the average person in a developing country, at what rate would they consume Earth's resources?

Eco-footprint
(developed country)

Developed population

Consumption estimate

Eco-footprint
(developing country)

Developing population

Consumption estimate
(developing country)

2. Talei wonders if Pareto's rule is a good estimate for resources used by developing countries.
 - a. How much of Earth's renewable resources does Pareto's rule predict the top 20 percent of consumers would use?
 - b. How well does Pareto's rule predict the actual share of Earth's resources used by developed and developing countries?
3. Why might people use a rule of thumb like Pareto's rule even if it's not perfect?

Activity Two

- In 2005, humanity's total ecological footprint was estimated at 1.3 Earths (in other words, we used 30 percent more resources than Earth could renew).
- The total land area of Earth is about 13 056 million hectares.
- At the start of 2009, the world had 6 778 070 000 people.

1. Based on Pareto's rule and the information above:
 - a. If the 20 percent who live in developed countries were using the products of 80 percent of the world's land area, how many hectares would these countries use?
 - b. What would this leave for the 80 percent in developing countries?
2. If people in developing countries need a bigger eco-footprint, what does this mean for New Zealand and other developed countries?

Focus

Using percentages to make comparisons
